Your work, carried forward.

The problem

Students move between class, recall and homework. Their unfinished work gets lost.

The product

A voice-led Mac workspace that connects calendar intent with saved work.

The first loop

Capture a lecture. Save the question. Practice it later. Record the actual attempt.

Show the work.

Learning

A handwritten board, spoken tutoring, clickable quizzes and independent checks.

Execution

Policy-gated tools, isolated shell commands and device-owner approvals.

Continuity

Goals, original sources and unfinished next actions persist in Console.

Validate the outcome.

First user

Build and test with the founder using Intermediate Microeconomics.

Next milestone

Run repeated sessions with students; measure completion and later independent recall.

Investor discussion

Which outcome should the pilot validate? What evidence would justify a larger trial?
